

#### Assignment 4 – Cyber Law

**Why Should Cyberspace be Regulated?** Cyberspace should be regulated because it is an emerging digital medium that requires laws to govern human behavior. It extends the physical world, which is already regulated. Since cyberspace is connected to the physical world, regulation ensures that cybercrimes are treated similarly to physical crimes.

**How Can an Intangible, Infinite but Dynamic Cyberspace be Regulated?** Cyberspace can be regulated by regulating users and the machines they use. Laws focus on accountability of individuals while indirectly controlling technology through legal standards and penalties.

**Why Regulate the Internet and Its Users?** Both the internet and users can be victims and perpetrators of cybercrimes. Regulation establishes rule of law, accountability, and protection of rights in cyberspace.

**Three Basic Building Blocks of Cyber Laws** 1. Netizens – users of the internet. 2. Cyberspace – the digital environment. 3. Technology – tools and systems used online.

**Netizens and Their Characteristics** Netizens use cyberspace as an extension of daily life. They can act anonymously, transcend borders, and perform activities without physical limits.

**Difference Between Netizen and Citizen** Citizens have constitutional rights tied to geography.

Netizens operate in cyberspace without direct constitutional recognition.

**Scope of Cyber Laws** Cyber laws regulate e-commerce, online contracts, copyright, trademarks, cybercrimes, e-taxation, and e-governance.

**Online Contracts** Online contracts are agreements formed electronically through offer, acceptance, and consideration.

**Copyright** Copyright protects original expressions such as text, images, music, and software.

**Trademark** A trademark identifies goods or services and protects business reputation online.

**Cybercrimes** Cyber laws provide tools to investigate and punish crimes involving computers and networks.

**Conclusion** Cyber law is essential for regulating activities in cyberspace, protecting users, ensuring accountability, and promoting safe digital development.
